

First blockchain-based crypto and digital asset inheritance service.

Digipulse is the world's first blockchain-based crypto and digital asset inheritance service, founded with the aim of ensuring that all digital asset holders and crypto wallet users have ultimate control over who inherits their assets.

While cryptocurrency is rapidly gaining global momentum, there is currently no viable solution for its glaring flaw — if a user cannot access their digital wallet, all their crypto assets will remain dormant and be forever lost. Legal documents, photos and other digital media might become equally inaccessible to family and friends without access.

Digipulse is actively solving this problem. Almost a year ago, co-founder and CTO Dmitry was having serious health issues and realised that, if he were to pass away, his young family would be unable to access his digital and crypto assets. After extensive market research, Dmitry realised that the service he himself needs simply doesn't exist. So he created one.

Active project development started in September 2016 and soon gained momentum after a successful ICO (or more precisely a Token Sale), that helped Digipulse raise more than \$1million worth of Ethereum for product development and team expansion.

The distinguishing advantage of Digipulse lies in its combined service flexibility. It operates with inheritable vaults, which can be modified anytime, contain any types of file and don't require lawyer and executor oversight. The inheritor also doesn't need any prior knowledge of the 'vault's' existence in order to access the contents.

Digipulse is currently a unique service in itself; it is the first digital inheritance platform with an in-depth focus on crypto assets. Blockchain technology allows Digipulse to encrypt, split, and store information on multiple devices across the world, ensuring both information and user anonymity as well as limiting human error.

Digipulse was established by two childhood friends – Normunds Kvilis, co-founder and CEO, and Dmitry Dementyev-Dedelis – co-founder and CTO.
